

Introduction

With this project my goal was to use Oracle VirtualBox to create two separate environments both dedicated to my cybersecurity practice as these environments will be crucial for future cybersecurity and ethical hacking journey.

Like this:

Here I show both computers running and are on the same IP address by using NAT network.

1st environment - offense/hacking

For the 1st environment I chose Linux as my choice of OS, and the distro I chose is Kali Linux because it comes with pre-installed tools and seen as a perfect distro for ethical hacking whether your blue team or red team. I can use tools such as Wireshark to monitor and most of my hacking will be used on the victim.

2nd environment - victim/vulnerable computer

For the 2nd environment I decided to use Metasploitable which derives from Linux and uses Ubuntu as the distro. It is barebones because that's the point it's supposed to have vulnerabilities to exploit using my offense environment. This is perfect for getting hands-on experience on ethical hacking.

Conclusion

Although this project seems small it is very impactful because it can lead you to learn many hands-on experiences. The skills I learned were GRUB management, partitioning, allocation, the basics of Linux, and being able to install new OS's. I would recommend any beginner to a project like this or similar.
